# A DBA's pick of Differences between SQL Server and Oracle

Jason Wong

<http://dbace.us>

Sr. Database Administrator  
IT Applications Manager  
Consultant, DBA Developer  
Programmer, App Admin

M.S. Mech. Eng. Rice '88, MBA U.H. '94 (MIS)

#408 | HOUSTON 2015

# A DBA's pick of Differences between SQL Server and Oracle

Jason Wong has 25+ years experiences working as programmer, apps admin, IT Applications Manager, Sr. DBA in greater Houston area.

Other interests includes: tennis, car repairs, taking photos in National Parks, cholesterol and Vitamin K2, D and Calcium

His career profile, education, publication, travel experiences, along with other interests can be found on his web site.  
(no commercials, no tracking)

<http://dbace.us>

# A DBA's pick for Differences of SQL Server and Oracle

Just for a laugh, in case you are seeing this on recording,  
you don't know how I look.

My stunt double speaking  
or just dangerous behavior

**NOT MY JOB**

**know  
enough  
to be  
dangerous**

**“It’s a good thing you’ve got rubber-soled shoes on. That could have gone all the way through you.”**

**Benjamin Franklin**

# A DBA's pick of Differences between SQL Server and Oracle

The software is evolving, so are we.  
The only constant is update.

# A DBA's pick of Differences between SQL Server and Oracle

For consistent grammar, we should say: Good, Gooder, Goodest

- Oracle license is more expensive.
- SQL Server is easier to learn.
- SQL Server has hot patch version upgrade.
- Windows service can automatic start.
- Oracle has more features and licenses.
- Oracle handles locking better.
- SQL Server implicit commit.
- Oracle trainings cost a lot of money.
- Documentation issues

# A DBA's pick of Differences between SQL Server and Oracle

1. Backup, Restore, Recovery (RMAN vs T-SQL/Powershell)
2. Schema (Single vs Multi tenants)
3. Alter Index Rebuild (fragmentation)
4. AWR, ASH vs DMV/DMF (Performance Trouble-shooting)
5. Data Guard (modes) vs AO Availability-Group (synchronous, asynchronous)

# Differences of SQL Server and Oracle Backup

Oracle RMAN Hot, **Cold** Backup + file copy  
Backup database ....

SQL Server Hot Backup + file copy  
Backup Database **To Disk = '....'**

\* See my SQL Saturday #308 for automated backup script

# Differences of SQL Server and Oracle Backup

**Cold backup** (not open and in noarchivelog mode):

```
RMAN>shutdown immediate;
```

```
RMAN>startup mount;
```

```
RMAN>backup database;
```

```
RMAN>alter database open;
```

(\* RMAN cannot backup database while open in noarchivelog mode)

**Hot backup** (open in archivelog mode):

```
RMAN> backup database;
```

```
RMAN>backup database plus archivelog;
```

```
RMAN>backup archivelog all;
```

```
RMAN>backup archivelog all delete input;
```

```
RMAN>backup archivelog all delete all input;
```

# Differences of SQL Server and Oracle Backup Retention Cleanup

## Oracle RMAN

- Show all configurable settings:  
RMAN> show all;
- Cleanup per retention settings.  
RMAN> configure retention policy to recovery window of 7 days;  
RMAN> configure retention policy to redundancy 1; #default
- RMAN catalog.

## SQL Server

Cleanup manually.

# Oracle Recovery

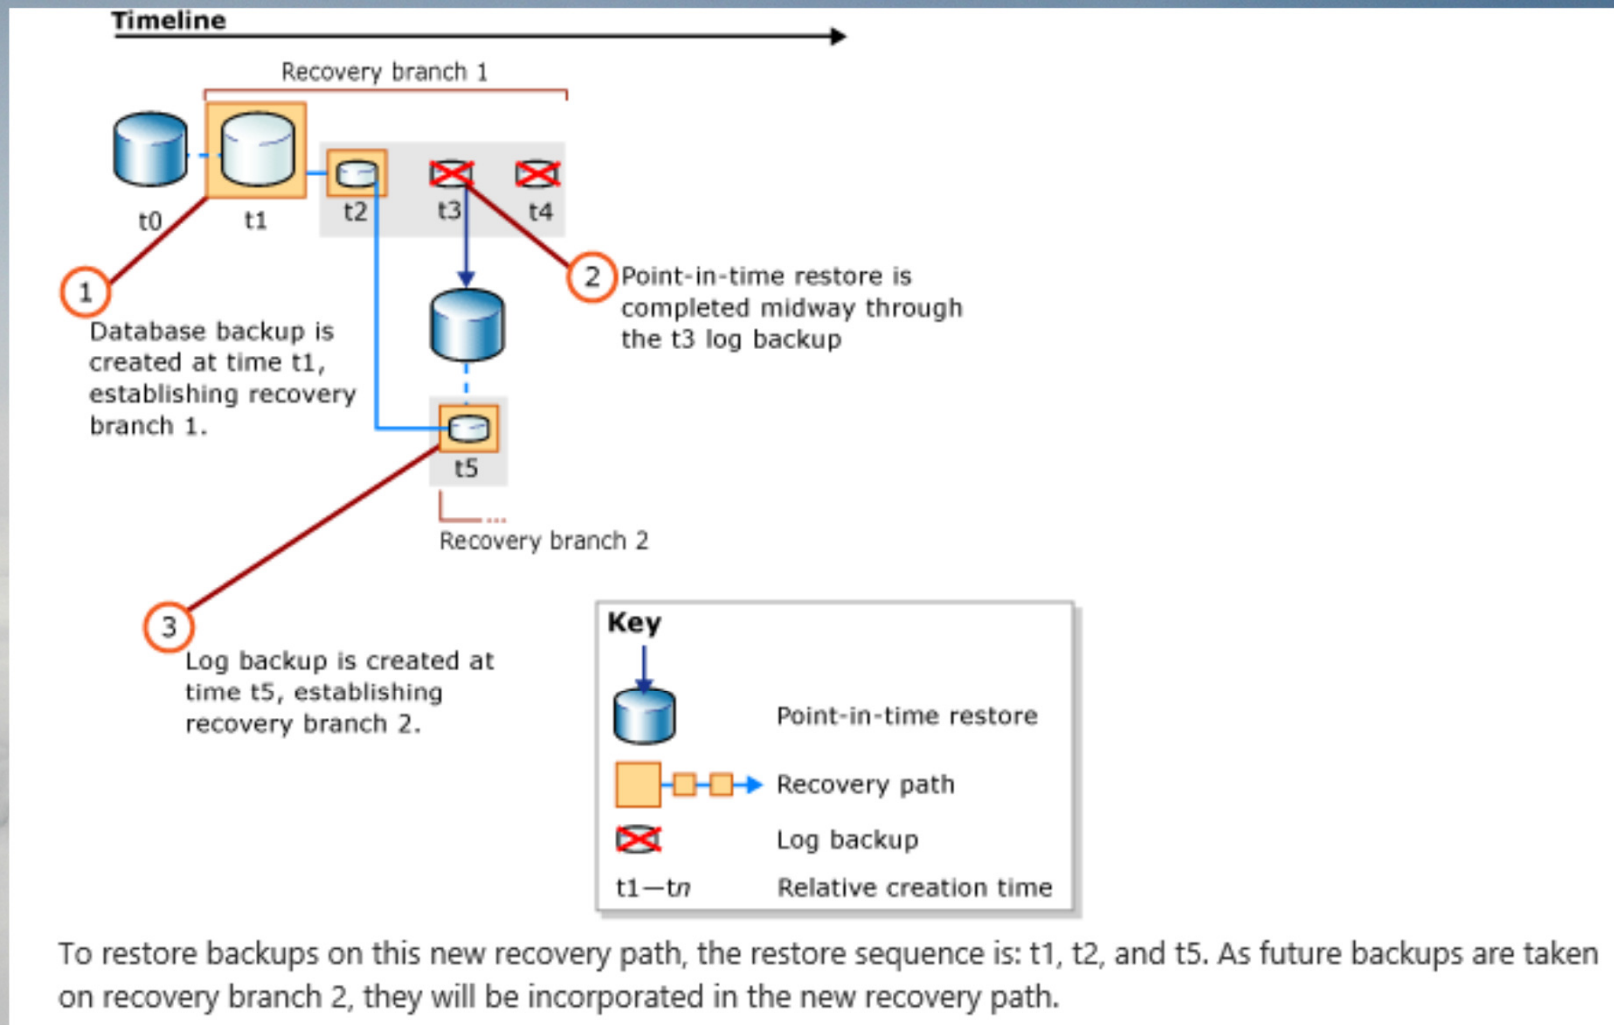

Figure 7-1 Database Incarnation History With Multiple Resetlogs

Description of "Figure 7-1 Database Incarnation History With Multiple Resetlogs"

Incarnation 1 of the database starts at SCN 1, and continues through SCN 1000 to SCN 2000. At SCN 2000 in incarnation 1, you perform a point-in-time recovery back to SCN 1000, and open the database with a **RESETLOGS** operation. This creates incarnation 2, which begins at SCN 1000 and continues to SCN 3000. At SCN 3000 in incarnation 2, you perform another point-in-time recovery and **RESETLOGS** operation. This creates incarnation 3, starting at SCN 2000.

# SQL Server Recovery

# Differences of SQL Server and Oracle Schema

- In the ANSI SQL-92 standard, a schema is defined as a collection of database objects that are owned by a single user and form a single namespace. A namespace is a set of objects that cannot have duplicate names.

# Differences of SQL Server and Oracle Schema

- Oracle – (An USER is a login).
  - Single-tenant database instance.
  - Segregation by schema. (until 12C)

SQL Server – (An USER is associated to a login).

- Multi-tenant database instance.
- Segregation by database.
- Mixed Windows and SQL Server authentication.

# Differences of SQL Server and Oracle

## Protection modes

Data Guard offers three data protection modes, which serve different business needs in terms of data protection and performance. You can find the properties of these modes in the following comparison table:

Mode	Redo transport	Action with no standby database connection	Risk of data loss
Maximum Protection	SYNC and LGWR	The primary database needs to write redo to at least one standby database. Otherwise it will shut down.	Zero data loss is guaranteed.
Maximum Availability	SYNC and LGWR	Normally works with SYNC redo transport. If the primary database cannot write redo to any of its standby databases, it continues processing transactions as in ASYNC mode.	Zero data loss in normal operation, but not guaranteed.
Maximum Performance	ASYNC and LGWR/ARCH	Never expects acknowledgment from the standby database.	Potential for minimal data loss in a normal operation.

\* By default, the standby database writes received redo data into the standby redo logfiles and apply services do not apply redo until the standby redo log is archived as an archived redo log (unless use real-time apply).
